

Analog Communication Technique Note 4

Main Points of AM

1. The AM signal consists of Carrier, USB and LSB signals. The USB consists of sum of carrier and message signal frequencies and LSB consists of difference of carrier and message signal frequencies.
2. Two conditions to meet the AM wave:
 - a. The carrier frequency f_c must be much greater than the message signal frequency W Hz. That is $f_c \gg W$.
 - b. For distortion less reception the modulation index must be less than unity, i.e. $0 < m < 1$.
3. The total power in AM is $P = P_c (1 + \frac{m^2}{2})$ where P_c is carrier power and m is modulation index.
4. The max power in AM wave is $P = 1.5P_c$ when $m = 1$.
5. Efficiency = $\frac{\text{Total sideband power (PSB)}}{\text{Total power } P} = \frac{m^2}{2 + m^2}$
6. The efficiency of AM wave depends on modulation index only and does not depend on either frequencies of modulating signal or carrier.
7. The maximum efficiency of AM occurs when $m = 1$ and Maximum efficiency is 33.33%.
8. The main disadvantage of AM is wastage of carrier power.
9. Another major disadvantage of AM is wastage of bandwidth, which is twice of message signal bandwidth.
10. The main advantage of AM is that, since a coherent reference is not needed for demodulation as long as, the demodulator becomes simple and inexpensive.
11. In many applications, such as commercial broadcast, AM is sufficient to justify its use.
