**11.02.02**

**6. Fill in the blanks and circle the correct words in the paragraph below.**

Like the human heart, the frog heart has **two** ventricles, a right atrium and ventricle, which receives oxygenated deoxygenated blood from the body and sends it to the lungs and ventricle, which receives deoxygenated oxygenated blood from the lungs and sends it to the body.

Frog heart is much larger relatively with the human. The average body temperature of a frog is 20-25 degrees C, compared to a human's average body temperature of 37 C. The outer wall of a frog's ventricle is thick as high as 100 micrometers, 40-50 times thicker than a frog's ventricle, which has a wall thinner than a human heart.

The frog's heart is adapted to handle the increased stress placed on it by its large ventricles. The wall of the heart is thick to hold back blood in the ventricle during contraction. The middle walls of the ventricles are thinner and more stretchy than those of the human. But the stress through contraction is much greater. The smooth walls and stretchy nature of the frog's heart allows blood to be pushed through the heart more easily than in a human.

The ventricles of the frog heart have thinner walls than those of the human. Externally, the ventricles appear more sturdy and powerful than in a human heart.
