

Chapter 5 Integumentary System:

Module 5.1: Overview of the Integumentary System:

- The skin consists of the superficial epidermis and the deeper dermis, which rests on the hypodermis.
- The integument serves many functions: protection, sensation, thermoregulation, excretion, and vitamin D synthesis.

Module 5.2: The Epidermis:

- Most of the cells in the epidermis are keratinocytes, which manufacture keratin.
- Dendritic cells are phagocytes in the stratum spinosum.
- Merkel cells are sensory receptors in the stratum basale.
- Thick skin has all five epidermal strata, and all five strata are thicker, particularly the stratum corneum.
- Thin skin lacks the stratum lucidum, and its four strata are thinner.

Module 5.3: The Dermis:

- The dermis consists of the papillary layer and the reticular layer.
- Folds of the papillary layer include dermal papillae and epidermal ridges.
- Gaps between collagen fibers in the reticular layer cause tension, or cleavage, lines.

Module 5.4: Skin Pigmentation

The primary pigment that influences skin color is melanin. Other substances that affect skin color are carotene and hemoglobin.

Module 5.5: Accessory Structures of the Integument:

- Hair, Nails, and Glands Hair, or pili, are composed of dead, keratinized keratinocytes that perform protective functions and sense the environment.
- Nails are located on the ends of digits and are derived from the epidermis.
