Periodic Table Introduction Edpuzzle Notes

- The periodic table is used to organize elements & and predict the chemical behavior of a certain component based on its location it

Metals are located on the left/middle portion of the periodic table

- Some properties are shiny, GOOD conductors of heat & electricity, ductile (can be turned into wires), and malleable (can be pounded into thin sheets w/out) breaking

Non-metals are found on the upper right section of the periodic table (except for H which is on the left)

- They are dull, and not good conductors of heat or electricity/ very brittle

Metalloids: found right around the staircase in the upper right area of the periodic table/ they surround the area that separates metals & non-metals (except Al, a metal)

- Metalloids have properties that are between metals and nonmetals

* the elements in the periodic table are arranged by increasing atomic #

Group: a column of elements

- The vertical columns in la periodic table are called GROUPS/FAMILIES
- Elements in the same GROUP/FAMILY share similar chemical properties because they have the same ending electron configurations

Period: horizontal rows in the periodic table/ the period represents the energy level of the atom (Alkaline Earth metals, not Alkali Earth metals)

- The periodic table we use today organizes the elements based on their ATOMIC #

* Mendeleev arranged the elements in his periodic table in order of increasing mass

* The elements between zinc & arsenic were gallium and germanium

- Mendeleev's periodic table could: encompass all known elements and accurately predict the existence of properties of undiscovered elements

The modern periodic table: organized by atomic #

- Mendeleev didn't know about the anatomy of an atom

1913: Henry Moseley (British physicist) arranged elements according to increasing atomic number.
