

Chapter 3 Psychometrics: Reliability and Validity

Every classroom assessment measure must be appropriately reliable and valid, be it the classic classroom achievement test, attitudinal measure, or performance assessment. A measure must first be reliable before it can be valid. In this chapter, we discuss the “basics” of classical test reliability and validity and how they relate to consistent (reliable) and accurate (valid) measurement.

I. Classical Reliability Indices

A. Introduction

1. Reliability is an indicator of consistency, i.e., an indicator of how stable a test score or data is across applications or time. A measure should produce similar or the same results consistently if it measures the same “thing.” A measure can be reliable without being valid. A measure cannot be valid without being reliable. The book, *Standards for Educational and Psychological Testing* (1999), provides useful guidance for all phases of test development.
2. The Four Types of Reliability
 - a. Test-Retest reliability (also called Stability) answers the question, “Will the scores be stable over time.” A test or measure is administered. Some time later the same test or measure is re-administered to the same or highly similar group. One would expect that the reliability coefficient will be highly correlated. For example, a classroom room achievement test is administered. The test is given two weeks later with a reliability coefficient of $r = .75$.
 - b. Parallel forms reliability (also called Equivalence) answers the question, “Are the two forms of the test or measure equivalent?” If different forms of the same test or measure are administered to the same group; one would expect that the reliability coefficient will be high. For example, Form A and Form B of a test of customer service knowledge or reading achievement are administered. The scores correlate at $r = .77$.
 - c. Internal consistency reliability answers the question, “How well does each item measure the content or construct under consideration?” It is an indicator of reliability for a test or measure which is administered once. One expects the correlation between responses to each test item to be highly correlated with the total test score. For example, an employee job satisfaction (attitude scale) or a classroom achievement test which is administered once.
 - d. Different raters, using a common rating form, measure the object of interest consistently; this is called inter-rater reliability. Inter-rater agreement answers the question, “Are the raters consistent in their ratings?” One expects that the reliability coefficient will be high, if the observers rated similarly. For example, three senior sales trainers rating the closing skills of a novice sales representative or master teachers rating the teaching effectiveness of a first or second year teacher.
