Analog Electronic Filters Hercules G. Dimopoulos,2011-09-18 Filters are essential subsystems in a huge variety of electronic systems Filter applications are innumerable they are used for noise reduction demodulation signal detection multiplexing sampling sound and speech processing transmission line equalization and image processing to name just a few In practice no electronic system can exist without filters They can be found in everything from power supplies to mobile phones and hard disk drives and from loudspeakers and MP3 players to home cinema systems and broadband Internet connections This textbook introduces basic concepts and methods and the associated mathematical and computational tools employed in electronic filter theory synthesis and design This book can be used as an integral part of undergraduate courses on analog electronic filters Includes numerous solved examples applied examples and exercises for each chapter Includes detailed coverage of active and passive filters in an independent but correlated manner Emphasizes real filter design from the outset Uses a rigorous but simplified approach to theoretical concepts and reinforces understanding through real design examples Presents necessary theoretical background and mathematical formulations for the design of passive and active filters in a

natural manner that makes the use of standard tables and nomographs unnecessary and superfluous even in the most mystifying case of elliptic filters Uses a step by step presentation for all filter design procedures and demonstrates these in numerous example applications

This book provides a comprehensive overview of signal filtering including an introduction definitions of the terms and algorithms for numerical calculation of the properties of the transfer function in frequency and time domains All the chapters discuss the theoretical background and explain the

underlying algorithms including the iterative numerical procedures necessary to obtain the solutions It starts by considering polynomial filters offering a broad range of solutions and introducing critical monotonic passband amplitude characteristics CMAc It also describes modifications to the classical Chebyshev and elliptic filters to overcome their limitations In the context linear phase low pass prototypes it presents filters approximating constant group delay in the equi ripple manner for the first time Further it discusses new procedures to improve the selectivity of all polynomial filters by introducing transmission zeros such as filters with multiple transmission zeros on the omega axis as well as phase correction of selective filters for both low pass and band pass filters Other topics explored include linear phase all pass exhibiting low pass group delay approximation filters all pass filters exhibiting band pass group delay approximation with linear and parabolic phase synthesized directly as band pass high pass and band stop amplitude characteristic frequency transformations to produce band pass and direct synthesis of linear and parabolic phase selective band pass filters synthesized directly as band pass Lastly for system physical synthesis the book describes the algorithms and procedures for the following cascade passive LC active cascade RC active parallel RC for the first time active parallel SC Gm C based on LC prototypes and parallel IIR based on bilinear transformation of analog prototypes Every algorithm be it in transfer function synthesis or in system synthesis is accompanied by a proper nontrivial comprehensive example produced by the RM software **Microwave Journal** ,1996
