The Sun

The Sun is a massive, glowing ball of gas that lies at the centre of our Solar System. It is classified as a medium-sized yellow star and, like all stars, it generates its own energy. This energy is produced deep inside the Sun through a process called nuclear fusion. In nuclear fusion, the Sun's high temperatures and pressures cause hydrogen atoms to combine (or fuse) to form helium. This fusion process releases enormous amounts of energy in the form of heat and light.

The Sun is incredibly large, so large that about 1.3 million Earths could fit inside it. It has a very strong gravitational force, which is why it holds all the planets, moons, asteroids and comets in orbit around it. The energy that the Sun emits travels through space and reaches Earth, where it is essential for life. Sunlight warms the planet, drives weather and ocean currents and powers photosynthesis in plants.
