Noise and Vibration Control for Building Services Systems ,2016 Noise and Vibration Control for Building Services Systems ,2016 This document which forms chapter 4 of CIBSE Guide B provides guidance to building services engineers and others involved in the design of building services on the generation prediction assessment and control of noise and vibration from building services so that designers may produce systems which meet acceptable noise limits Noise reduction procedures are always much more effective and economic when introduced at the design stage than when applied retrospectively Therefore it is important that the issue of noise is taken into account at an early stage of the design process involving advice from an acoustics expert in particularly noise sensitive situations The aim of this chapter is to provide guidance to enable building services systems to be designed to achieve acceptable levels of noise in addition to meeting requirements relating to aerodynamics energy usage and economics *Prediction and Control of Noise and Vibration from Ventilation Systems* Cheuk Ming Mak,Kuen Wai Ma,Hai Ming Wong,2023-08-21 This book addresses the prediction and control of noise and vibration in ventilation systems and their psychoacoustic effects on people The content is based on the authors research and lecture material on building acoustics and provides insights into the development of prediction methods and control of noise and vibration from ventilation systems and an assessment of their psychological effects on people The basic principles and methods for prediction and control of noise and vibration from ventilation systems are discussed including the latest developments on flow generated noise prediction assessment methods for the performance of vibration isolation noise control using periodic Helmholtz Resonators and holistic psychoacoustic assessment of noise from ventilation systems The insightful book on noise and vibration in ventilation systems Extends into prediction control and psychoacoustic assessment methods The book suits graduate students and engineers in acoustics and noise and vibration control as well as in building services engineering and across the built environment **Environmental Design** Randall Thomas,2006-06-07 Written and edited by a team of specialists at Max Fordham LLP one of the UK s leading environmental and building services engineering consultancies Environmental Design is the result of their extensive experience in designing environmentally friendly buildings The principles of their approach which they have taught in numerous schools of architecture and engineering are clearly presented here The book starts with some basic scientific principles and environmental issues and then moves on to site planning energy use materials and building form Natural ventilation systems high efficiency mechanical equipment and alternative energy sources are also covered State of the art buildings of exceptional quality are incorporated throughout the text and illustrate the authors belief that environmentally responsible architecture can be visually exciting They conclude with a selection of detailed case studies of award winning projects including new for this third edition Beaufort Court King s Langley and the National Trust Headquarters Swindon This book is essential reading for architects engineers planners and students of these disciplines *Refrigeration, Air Conditioning and Heat Pumps* G F

document was published in 1962 by the Illuminating Engineering Society A revision was published in 1972 Since then attitudes towards the lighting of buildings have changed Some of the reasons for this are the considerable increase in the cost of energy and the recognition of the need to use it efficiently in the commercial sector particularly the use of computers has resulted in different approaches to the use of space within buildings The earlier document concerned itself mainly with design for daylight This new document while sharing this concern brings together in greater detail than before the other design factors which are influenced by daylight design decisions It is all too easy to design windows to provide daylight and at the same time create problems of unwanted noise intrusion glare summertime overheating and energy waste This guide provides designers with a means of identifying the important factors and a method of solving some of the design problems which will inevitably arise The reader's attention is drawn to the fact that in applying data and ideas from the different sections of the guide there will inevitably be a need to retain a balance between often conflicting requirements This document is intended to supplement the current range of CIBSE documentation and there is ample cross referencing The guide is divided into Part A Design sequence and Part B Design information The reference numbers throughout Part A and the supplementary numbers within the sectional reference lists in Part B refer to the Classified Bibliography on page 64 Part A guides the designer through the various stages of design and indicates the interaction between daylighting considerations and others It is cross referenced to Part B which provides more detailed guidance on prediction methods and basic data along with references to the relevant CIBSE publications The design information section is longer than the design sequence which it supports This is inevitable when alternative evaluation and prediction methods are provided It is not envisaged that a designer would ever work step by step through the whole design sequence For this reason Part A is set out in a three column format to enable the reader more easily to locate the particular material which interests him from the left hand column to read the relevant text in the centre column and to pick up the references from the right hand column Many aspects of window design may legitimately be based on experience or intuition rather than on formal analysis for example the use of splayed reveals the position of glazing bars and the use of the colour The role of the design sequence is to prompt the designer when he reaches an impasse and to offer a rational basis for decision making whenever necessary This publication refers to the design of conventional windows in the United Kingdom though it may also apply to other localities with a similar climate Some of the procedures presented are relatively new for example the concept of average daylight factor Although values of average daylight factor have been recommended it should be noted that experience of what the precise values imply in terms of daylight quality and quantity is limited and the recommendations may be changed in the light of experience On a similar note some of the techniques presented for designing conventional windows may not be totally reliable when applied to atrium design Therefore caution is urged when applying the content of the guide to anything other than conventional fenestration In this content window covers vertical glazing in walls and glazing in sloping environments such as

roofs Some aspects of window design are beyond the scope of this guide such as constructional methods or problems of strength or weather tightness Guidance on these aspects can be obtained from the window manufacturers *Bulletin de l'Institut international du froid* International Institute of Refrigeration,1998 **CIBSE GUIDE BO** ,
