Circular functions

Solutions for Test 1

SECTION A – Multiple-choice questions

Question 1: B

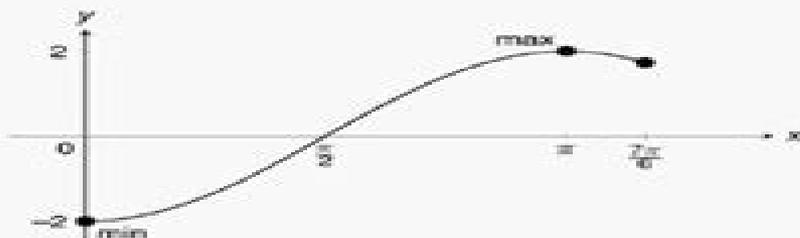

The period of a tangent graph is different to a sine and cosine graph. It is given as $\frac{\pi}{n}$. As we can find n from the question, the period of $f(x)$ is $\frac{\pi}{(\frac{2}{5})} = 2.5$.

Question 2: A

While it is possible to graph each option and select the one that matches the question, it is also possible to use a process of elimination. From the given graph, we know that it must pass through $(0, 0)$, which rules out all options except A.

Question 3: B

Since this is a cosine graph, we cannot simply substitute in the end points of the domain $[0, \frac{7\pi}{6}]$ as these may be a turning point(s) in the domain.

We can see that the maximum value of y is actually 2 and not the value at $x = \frac{7\pi}{6}$. Thus, the range is $y \in [-2, 2]$.

Question 4: A

When determining the rule from a graph, pay attention to important features like intercepts. Moreover, if the domain has been restricted, double check that the correct domain has been stated as part of the rule! The graph shown has an amplitude of 1, indicated by the y -axis labels, hence ruling out C and D (which each have an amplitude of 2). However, since we don't have x -axis labels to work with, we will have to use our knowledge of circular functions to deduce the answer from here. Two full periods are shown on either side of the y -axis, so the interval of the domain must cover twice the coefficient of x . Options B and E do not satisfy this requirement, leaving A as the correct answer.

Question 5: C

This should be done on your CAS – don't waste time in multiple-choice question solving trig equations by hand!

$$\begin{aligned}\sin(2x) &= \frac{\sqrt{3}}{2} \\ 2x &= \frac{\pi}{3} + \frac{2\pi}{3}, \dots \\ \therefore x &= \frac{5\pi}{6}, -\frac{2\pi}{3}, \frac{\pi}{6}, \frac{\pi}{3}\end{aligned}$$

We can check this by summing the solutions to ensure they equal $-\pi$:

$$\left(-\frac{5\pi}{6}\right) + \left(-\frac{2\pi}{3}\right) + \frac{\pi}{6} + \frac{\pi}{3} = -\pi$$

Evolutionary Computation Techniques: A Comparative Perspective Erik Cuevas, Valentín Osuna, Diego Oliva, 2016-12-28 This book compares the performance of various evolutionary computation EC techniques when they are faced with complex optimization problems extracted from different engineering domains Particularly focusing on recently developed algorithms it is designed so that each chapter can be read independently Several comparisons among EC techniques have been reported in the literature however they all suffer from one limitation their conclusions are based on the performance of popular evolutionary approaches over a set of synthetic functions with exact solutions and well known behaviors without considering the application context or including recent developments In each chapter a complex engineering optimization problem is posed and then a particular EC technique is presented as the best choice according to its search characteristics Lastly a set of experiments is conducted in order to compare its performance to other popular EC methods
