

Chapter 5 – Elasticity and Its Applications

Do they depend both on the numbers of firms and on the price?

- What is elasticity? What kinds of factors can increase, decrease, or stabilize it?
- What is the price elasticity of demand? How is it related to the demand curve? How is it related to demand's steepness?
- What is the price elasticity of supply? How is it related to the supply curve?
- What are the income and cross-price elasticities of demand?

Key concepts:

Two things influence the price of a resource:

the change in the number of resources and the change in the number of firms.

How does the price change considering the opportunity cost of your time, the value of the leisure time you spend on leisure?

How does the number of firms that are willing to supply resources if you have your own time? How does that number change? How does it affect the overall level of output and the resource?

Key ideas:

- Elasticity: Elasticity measures how much the variable responds to changes in another variable.
 - One type of elasticity measures how much demand for one variable will fall if another variable changes.
- Definition: Elasticity is a numerical measure of the responsiveness of Q^D or Q^S to a change in its determinants.

Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P .
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a demand curve, P and Q move in opposite directions, which usually makes price elasticity negative. We will drop the minus sign and report absolute values for positive numbers.

Example:

The price elasticity of demand for apples is 0.5. If the price of apples falls by 10%,

Calculating Percentage Change

Quantity demanded will increase by 5 percent.

Example 2:

If the price of apples falls by 20%,
