

PFC Cuk Converter Fed BLDC Motor Drive

Vandana Dixit, Student Member, IEEE and Dharm Singh, Fellow, IEEE

Abstract— This paper deals with a power factor correction (PFC) based Cuk converter fed brushless DC motor (BLDC) drive as a cost effective solution for low power applications. The speed of the BLDC motor is controlled by varying the DC link voltage of bridge inverter (BVI) which uses a low frequency switching of VSI (inverter) combination of BLDC motor for low switching losses. A single bridge inverter (BVI) fed by a VSI converter working in discontinuous conduction mode (DCM) is used for control of DC link voltage with unity power factor at AC source. Performance of the PFC Cuk converter is evaluated in four different operating conditions of discontinuous and continuous conduction mode (CCM) and a comparison is made to select a best suited mode of operation. The performance of the proposed system is simulated in MATLAB/Simulink environment and a hardware prototype of proposed drive is developed to validate its performance over a wide range of speed with unity power factor at AC source.

1. INTRODUCTION

BRUSHLESS DC (BLDC) motors are recommended for many low and medium power drives applications because of their high efficiency, high flux density (low cost volume), low maintenance requirements, low EMI problems, high ruggedness and a wide range of speed control [1, 2]. Due to these advantages, they find applications in numerous areas such as household appliances [3], transportation (hybrid vehicles) [4], aerospace [5], heating, ventilation and air conditioning (HVAC) [6], motor control and robotics [7], renewable energy applications [8, 9] etc. The BLDC motor is a three phase synchronous motor consisting of a stator having a three phase concentrated windings and a rotor having permanent magnets [10, 11]. It doesn't have mechanical brushes and commutator assembly, hence wear and tear of the brushes and sparking issues as in case of conventional DC machines are eliminated in BLDC motor and thus low loss (EMI) problems. This motor is also referred as electronically commutated motor (ECM) since an electronic commutation based on the Hall-effect rotor position signals is used rather than a mechanical commutation [12, 13].

There is a requirement of an improved power quality as per the international power quality (PQ) standard IEC 61000-3-2 which recommends a high power factor (PF) and low total harmonic distortion (THD) of AC source current for 1-kVA applications ($1-200W$, $-10A$) which includes many household appliances [14]. The conventional nature of a BLDC motor fed by a double bridge inverter (DBVI) and a high value of DC link capacitor drives a non-continuous current. Thus AC source current is not in harmonic such that the THD of supply current is as high as 60%, which results in power factor as low as 0.8 [15]. These types of power quality indices can't comply with the international PQ standards such as IEC 61000-3-2 [14]. Hence, single-phase power factor correction (PFC) converters are used to attain a unity power factor at AC source [16, 17]. These converters have gained attention due to single stage operation for DC link voltage control with unity power factor at AC source. It also has low component count as compared to boost stage converter and therefore offers reduced losses [17].

Conventional schemes of PFC converters fed BLDC motor drive utilize an approach of constant DC link voltage of the VSI and controlling the speed by controlling the duty ratio of high frequency pulse width modulation (PWM) signals [18-21]. The issues of VSI in such type of configurations are considerably since switching losses depend on the square of switching frequency ($P_{sw} \propto V^2$) [22] as in [18] have proposed a boost PFC converter based direct torque controlled (DTC) BLDC motor drive. They have the disadvantages of using a complex control which requires large amount of memory and higher and digital signal processor (DSP) for attaining a DTC operation with PFC at AC source. Hence, this scheme is not suited for low cost applications. Hu et al. [19] have proposed an active power factor correction (APFC) scheme which uses a PWM consisting of VSI and motor has high switching losses. Wu et al. [20] have proposed a cascaded buck-based converter fed BLDC motor drive, which utilizes two switches for PFC operation. This offers high switching losses in the boost and converter due to double switch and reduces the efficiency of overall system. Gopalakrishnan et al. [21] have proposed a single ended primary inductor converter (SEPIC) as a boost and converter for PFC with DC link voltage control approach, but utilizes a PWM switching of VSI which has high switching losses. Bridgeless configurations of PFC buck-based, Cuk, SEPIC and Δ bc converters have been proposed in [22-24] respectively. These configurations offer reduced losses in the boost and converter but at the cost of high number of positive and active components [22-24].
