General Introduction

What are Greenhouse Gas Conversion Factors?

Greenhouse Gases can be measured by recording emissions at source by continuous emissions monitoring **or** by estimating the amount emitted using activity data (such as the amount of fuel used) and applying relevant conversion factors (e.g. calorific values, emission factors, oxidation factors).

These conversion factors allow organisations and individuals to calculate greenhouse gas (GHG) emissions from a range of activities, including energy use, water consumption, waste disposal, recycling and transport activities. For instance, a conversion factor can be used to calculate the amount of greenhouse gases emitted as a result of burning a particular quantity of oil in a heating boiler.

These conversion factors will enable you to convert activity data (e.g. litres of fuel used, number of miles driven, tonnes of waste sent to landfill) into kilograms of carbon dioxide equivalent (CO₂eq). Carbon dioxide equivalent is a universal unit of measurement used to indicate the global warming potential of one unit of carbon dioxide. It is used to evaluate the releasing of different greenhouse gases against a common basis.

What are the major changes and updates from the June 2008 version?

Major changes and updates from the June 2008 version are as follows:

- i. In previous versions of the conversion factors, emissions factors have only been provided for CO₂. The 2009 update provides emissions factors for the non-CO₂ greenhouse gases methane (CH₄) and nitrous oxide (N₂O) as well, based upon the emission factors used in UK Greenhouse Gas Inventory (GHGI). Values for CH₄ and N₂O are presented as CO₂ equivalents (CO₂eq) using Global Warming Potential (GWP) factors (GWP for CH₄ = 21, GWP for N₂O = 310), consistent with reporting under the Kyoto Protocol and the second assessment report of the Intergovernmental Panel on Climate Change (IPCC).
- ii. Lifecycle emissions factors for water, waste, biofuels and biomass have been added. These emission factors include both direct and indirect emissions. For example in the case of biofuels, these emission factors incorporate emissions associated with the production and transportation of the fuel, as well as the direct emissions from fuel combustion. **As a result, these emission factors are different from all other emissions factors in the annex which only account for direct emissions.**
- iii. Global Warming Potentials for greenhouse gases not covered by the Kyoto Protocol have been added.
- iv. Emission factors for air conditioning and refrigeration have been added.
- v. International electricity emission factors have been added.
- vi. A supporting methodological paper to explain how all of the emission factors have been derived has been produced. This methodological paper can be found here:
