

Some of the DNA replication enzymes:

Topoisomerase- unwind DNA helix structure (change DNA topography);

DnaA protein opens replication origin to form replication bubble;

DNA - helicase-

break H-bonds between base pairs;

this creates a **replication fork**;

Y-shaped structure;

with single stranded DNA section;

DNA polymerase III-

for polymerisation in prokaryote

Delta DNA polymerase;

for polymerisation in eukaryote

NB: 4 & 5 above also proof read a nucleotide they just added

Leading strand:

daughter strand continuously made towards

a growing replication fork;

because 3' → 5' direction of reading parent

template is towards the growing Replication fork;

so its synthesised just behind the leading strand

Lagging strand:

daughter strand discontinuously made in

opposite direction of a growing replication fork;

- because 3' → 5' direction of reading the parent template

- is away from the growing Replication fork;

Okazaki fragments;

several short DNA strands;

joined to primers;

growing away from replication fork;

later join to make the daughter DNA lagging strand;

DNA Primase; - add short RNA nucleotides called RNA primers;

RNA primers; - short RNA nucleotide used to make double strand &

provide initial 3' C- OH for polymerising DNA polymerase like 5 & 5 above to start work;

DNA polymerase I - remove of RNA primers then replace them with DNA nucleobides;

DNA ligase- join DNA fragments like Okazaki fragments to form the continuous DNA strand;
